ECON 340 Economics Research Methods

Div Bhagia

Lecture 7: Data Analysis in R

So far

```
# Load Packages
library(tidyverse)
# Set directory (optional)
#setwd("~/Dropbox (CSU Fullerton)/Econ340_R")
# Import data
data <- read.csv("caschool.csv")</pre>
```

You can clear your environment before starting by using the broom on the top-right. Or add rm(list=ls()) command on top of your R-script.

Tabulating Variables

61

##

359

 Variable gr_span reports the grade span of a school district (K-6 or K-8)

```
table(data$gr_span)
##
## KK-06 KK-08
```

 So 61 school districts go up to grade 6 while 359 go up to grade 8

Dplyr Syntax

- dplyr is a TidyVerse package that provides several useful functions for data manipulation
- However, dplyr uses slightly different syntax from base R.
- One key operator utilized by this package is the pipe operator %>%
- You can use shortcut Cmd + Shift + M (Mac) and Ctrl + Shift + M (Windows) for %>%
- You can think of this operator as standing for "then" in the code

Dplyr Syntax

2 KK-08 359

For example, to tabulate data:

```
data %>% count(gr_span)

## gr_span n
## 1 KK-06 61
```

Some Useful dplyr Functions

- mutate() adds new variables that are functions of existing variables
- select() picks variables based on their names
- filter() picks cases based on their values
- summarise() reduces multiple values down to a single summary
- arrange() changes the ordering of rows
- group_by() performs subsequent calculations within-group (and ungroup() when done)

Select Variables

```
data %>% select(computer, enrl tot)
```

```
##
        computer enrl tot
## 1
               67
                        195
              101
                        240
## 2
## 3
              169
                       1550
                        243
## 4
              85
## 5
              171
                       1335
## 6
              25
                        137
## 7
              28
                        195
## 8
               66
                        888
## 9
               35
                        379
```

7 / 16

Finding Correlation

enrl tot 0.9288821 1.0000000

```
# Base R
cor(data$computer, data$enrl tot)
## [1] 0.9288821
# Tidy way
data %>% select(computer, enrl tot) %>% cor()
##
             computer enrl tot
## computer 1.0000000 0.9288821
```

Filter Observations

```
data %>% select(gr_span, computer) %>%
  filter(gr_span=="KK-06")
```

9 / 16

```
##
      gr_span computer
        KK-06
## 1
## 2
        KK-06
                     742
## 3
        KK-06
                     324
## 4
        KK-06
                     669
                     196
## 5
        KK-06
## 6
        KK-06
                     560
        KK-06
                    1048
## 7
## 8
        KK-06
                     505
```

And and Or in R

To select schools in Orange county with enrollment over 5000

```
data1 <- data %>%
  filter(county=="Orange" & enrl_tot>=5000)
```

To select schools that are either in Orange country or in LA county

```
data2 <- data %>%
  filter(county=="Orange" | county=="Los Angeles")
```

Summarize Variables

sd

1 441 3413 0 1254644

##

```
# Calculating mean
data %>% summarise(mean(computer))
    mean(computer)
##
## 1
           303.3833
# Standard deviation and median
data %>% summarise(sd = sd(computer),
                   med = median(comp stu))
```

med

11 / 16

Creating New Variables

```
data <- data %>%
  mutate(log_enrl = log(enrl_tot))
```

- The code takes data and adds a new column log_enrl, which is the log of enrl tot
- It then updates the original data with this new column.

Creating New Variables

```
data <- data %>%
  mutate(hcomp = ifelse(comp_stu>=median(comp_stu),1,0))
```

- Syntax: ifelse(test_expression, x, y)
- The returned vector has element from x if the corresponding value of test_expression is TRUE and y if it is FALSE.
- So here hcomp takes value 1 whenever computers per student are above the median, and 0 otherwise. What should be the output from mean(data\$hcomp)?

Combining group_by() and summarise()

```
data %>%
  group_by(hcomp) %>%
  summarise(mean(comp_stu))
```

Excercise for you

Find the county with the highest average number of computers per student (comp_stu) (Hint: Use group_by(county) and summarise())

What's next?

- Next class we will continue with R
- Problem set 2 is available on Canvas and is due next Tuesday (09/19)
- Get in touch with your research group partner(s) and start thinking about your project
- Research Paper First Submission is due in two weeks (09/26)
